

# Are Deaths and Adverse Health Effects After Vaccination Against Covid 19 Related in a Pathologically Detectable Way

## PARTIAL TRANSCRIPT

Blood after a Covid vaccine becomes really beautiful Pathology Conference Press conference: Death by vaccine/ undeclared & Covid-19 vaccine components

Lawyer Viviane Fischer: Could you briefly explain who or what these images are from?

You spoke of several different sources.

—Yes.

These are leftover vaccines from the company BioNTech-Pfizer.

MD Ute Langer: This one is quite astonishing.

It is moving. It appears to be an accurately constructed object.

Here dark-field microscopy was used with a slide.

So, there are two slides. One on the bottom with a drop of the vaccine substance and one on top as a cover so nothing slips or drips out. This is what was observed using dark-field microscopy.

Precisely. There it goes, out of the field of view.

So, in another batch of BioNTech, this was found.

Actually, the way it looks, it could be a chip.

At this point, I would like to say that this structure has been observed by others examining vaccine contents, which is most likely included in this presentation. Dr. Barbel Gitala had the same findings.

There is movement in the BioNTech sample, which can be seen here very well.

That could be the part of the vaccine called Nano-Lipids. —Nano-Lipids. —The dots of light.

We discovered particles in sizes ranging up to 0.5 millimeter.

Yes. —Up to the size of 0.5 millimeter.

By the way, Professor Burkhardt also found them using light microscopy.

## **Are Deaths and Adverse Health Effects After Vaccination Against Covid 19 Related in a Pathologically Detectable Way**

This is a sample of Johnson & Johnson. It's gigantic.

Again, we see these structures inside. —With sharp edges.

Perhaps, at this point, the experts could comment about what happens when something of this size enters capillary vessels?

If it enters into the lymph nodes, it could cause complications.

First of all, it is very, very big, right?

For the small capillary vessels, it is too big.

These floaters were observed in other batch samples.

The form is always the same, so the appearance isn't a coincidence and shows up frequently.

The small object above it is also moving.

Here we see the blood of a vaccinated patient.

The blood cells are forming into rolls with another object loops around throughout the image.

It isn't a hair, or fiber. We took a comparative photograph with both, with a fiber etc.

It appears to be one of these graphene layers.

It's extremely long. —And it is dually refractive. —Dually refractive, exactly.

What does dually refractive mean? —That it is a foreign object.

Yes, well, I think the pathologists could explain dually refractive better.

It isn't organic. Not biological, at least that is how it appears.

This is a sample from one of my patients who, following the second vaccine, is paralyzed on the left side.

She also now has flare-ups of MS [Multiple sclerosis] regularly.

## **Are Deaths and Adverse Health Effects After Vaccination Against Covid 19 Related in a Pathologically Detectable Way**

She also now has autoimmune antibodies, the cerebral kind. This image was taken Six month after the vaccine. These metal splinter objects are seen here dancing around.

The blood cells shown here have a thorn-shaped appearance and are no longer alive.

The only things remaining alive are these particles. —And the phagocytes? The white part?

Is it a phagocyte? —Yes. —A white blood cell trying to remove impurities and is obviously failing to do so.

There's one above, and to the right of the phagocyte.

Lawyer Holger Fischer: Here is another BioNTech-Pfizer vaccine, below in the image, can we enlarge it?

This is the BioNTech vaccine. There are leftover portions, and these leftovers remained cooled until we get them.

Once they are put under the microscope, the substance warms up and is very active.

Here again we see this floating “hanger”.

Similar to the first image we saw, with the same structures.

Appearing once again, we also see particles moving in the fluid of the vaccine.

Another interesting thing is that no special microscope is needed.

With some luck, these things can be observed with a light microscope or much of this can be seen with a light microscope. So that begs the question, as well as from a legal aspect: Why doesn't the Paul Ehrlich Institute ever see these things?

I suspect this is due to the fact that they only go by appearance.

So, if there's nothing visibly floating around in it when they look at the vial, then that's apparently sufficient.

However, if they were to take a closer look, they would see these things, because everyone can see these things.

# **Are Deaths and Adverse Health Effects After Vaccination Against Covid 19 Related in a Pathologically Detectable Way**

Everyone can see the impurities. Repeatedly, they are being found.

Not just Japan, as recently announced with the Moderna vaccine.

Nov. 29, 2021 — Doctor's office in Saxony. Live blood samples from four vaccinated and four unvaccinated people. Compared and examined.

The doctors in this practice here in Saxony have provided images of vaccinated blood samples.

The following is an explanation of the images and why they were taken. I will focus on the screen.

Firstly, we see here an object, which we will also see in the images of the vaccine substance alone.

This person was vaccinated. (blood sample)

I'll proceed to the next image.

Here we see the vaccine substance from BioNTech under the microscope.

So after approximately ten hours, these worms hatched. Here you see the two eggs.

These two worms hatched from these two eggs.

This is a structure that formed after ten hours.

When I first looked at it, it was cloudy, but then it starts to form after a certain time.

My assumption is that these are nanoparticles that come together into a form, and here is a rounded area.

What is it? It could be a microchip or something else.

Down here we see another egg.

I'll show more of those later, because there are quite a few.

Here we can see, once again, within a biofilm, an undefinable structure.

Why would this be in a vaccine? No one can tell me.

## **Are Deaths and Adverse Health Effects After Vaccination Against Covid 19 Related in a Pathologically Detectable Way**

This here looks like glass to me. In the vaccine.

Yes, when you look at it here on the cell phone camera, the sharp edges are very recognizable. They shine.

—And transparent. To me

—Yes. Absolutely, the transparency is observable.

—Yes.

In contrast, here's another worm.

—What size are these worms to be seen with dark-field microscopy?

The measurement is 40,000; it's set on 40,000 enlargements.

40,000 what? —Nanometers. It says it there.

40,000 nanometers. —Here there is a dark area, meaning it is in-transparent.

However, the edge reflects the light. Whether it is metal or not, I have no idea.

There's no reason for it to be in a vaccine.

These structures formed on their own. Why? I have no idea why that is.

Hold on, I've gone a bit too fast, so back. Here we see very well a complete worm.

You see on the inside and here is the digestive track. And here the sexual organs begin.

The tail still being present has a meaning. I allowed the sample to dry out for 24 hours

and these parasites, I'll just call them parasites, normally should drop their tail.

If it was a fiber, some chemical fiber, it would be completely black.

What kind of worms are they? Do their bodies give clues to what they are? Anything at all?

## **Are Deaths and Adverse Health Effects After Vaccination Against Covid 19 Related in a Pathologically Detectable Way**

Anyone can search for it on the internet. These worms cause cancer: they can cause severe pain as in rheumatoid diseases, joint pain, or even Alzheimer's if they infest the brain.

Now the system-loyal will screech and cry out: It's all a conspiracy theory!

However, after this MSM news footage from SWR, they'll shut up really quick.

Southwest TV News / Ulm University (May 26, 2021) —It's frightening or at least surprising, say researchers at Ulm University, who discovered impurities in the vaccines.

They examined vials of AstraZeneca. In each vial they found (up to) two-thirds of the contents contained substances that don't belong there, and only one-third was actually vaccine material.

This is relatively unusual and wasn't expected.

Prof. Kochanek was unable to explain these foreign substances, which shouldn't be in vaccines, or what they can do to people.

There's no direct connection to sinus thrombosis, but that's problematic because it also cannot be excluded as a cause.

The team has examined four batches of vaccine and passed on the results six weeks ago to government authorities, the EMA, the STIKO and the Paul Ehrlich Institute, without any known responses.

Not even the manufacturer responded to the findings.

—The manufacturer showed interest, but no further feedback was received from the company.

Perhaps the effectiveness of the vaccine could be improved, if there were fewer impurities in it.
