A research paper found that people who did not receive a COVID-19 vaccine had a lower rate of suffering a severe case of the virus amidst the pandemic.

The article, which has been uploaded to the preprint server ResearchGate, relied on data from over 18,500 respondents across 175 countries. Analysis revealed that individuals unvaccinated against COVID-19 reported fewer instances of hospitalization in comparison to their vaccinated counterparts.

MSN – a news website launched by vaccine enthusiast Bill Gates’s Microsoft in 1995 – covered the study, titling its article “*Severe COVID-19 ‘Rare’ In Unvaccinated People,*” but appears to have taken down the story since its publication. Archived versions of the article are still [available](#), however.

The survey – “*Self-reported outcomes, choices and discrimination among a global COVID-19 unvaccinated cohort*” – was conducted from September 2021 through February 2022. Data collected for the survey was analyzed by an independent, international team of scientists led by Robert Verkerk, Ph.D., the founder and executive and scientific director of Alliance for Natural Health International.

“It is important to recognize that because the cohort represents a self-selected, as opposed to randomly selected, sample, the findings cannot be directly compared with other observational studies based on self-reported data based on randomly selected subjects,” emphasized the study.

Many of the unvaccinated individuals included in the analysis opted for natural treatments such as vitamin D, zinc, quercetin, and drugs such as ivermectin and hydroxychloroquine.

The study also found that people unvaccinated against COVID-19 faced discrimination for their decisions, with between 20 to 60 percent of people per country reporting being personal targets of “hate or victimization.”

“Respondents reported feeling even more victimized by their respective states, with rates among respondents being greatest in Southern Europe (61%), Western Europe (59%), Australia and New Zealand (57%) and South America (57%),” explained the paper.

The survey follows additional studies reaching similar conclusions about the efficacy of the COVID-19 vaccine. A Koch Institute report assessing data from the German government, for example, found that 80 percent of cases of the Omicron variant occurred in fully vaccinated people in the country.
